

DAY 7 MORNING ASSIGNMENT (01/02/2022)

BY SARATH PHANI KASIMSETTY

- 1) Create Employee class with three variables and two methods
RaedEmployee and PrintEmployee and create an object and call methods.

CODE:

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;

namespace Day7MorningProject1
{
    internal class Employee //class of employee
    {
        // private variables
        private int id;
        private string name;
        private int age;
        private int salary;

        // public methods dealswith variables
        public void ReadEmployee() //read values from user
        {
            Console.WriteLine("Enter the EmpId :");
            id = Convert.ToInt32(Console.ReadLine());

            Console.WriteLine("Enter the Name :");
            name= Console.ReadLine();

            Console.WriteLine("Enter the Age :");
            age= Convert.ToInt32(Console.ReadLine());

            Console.WriteLine("Enter the Salary :");
            salary = Convert.ToInt32(Console.ReadLine());
        }

        public void printEmployee() //pint employee details of function call
        {
            Console.WriteLine("EmpID : {0}, Name : {1}, Age : {2}, Salary : {3}", id,
name, age, salary);
        }
    }
    internal class Program
    {
```

```
static void Main(string[] args)
{
    Employee emp1 = new Employee(); //read values from user
    emp1.ReadEmployee();
    emp1.printEmployee();

    Console.ReadLine();
}
}
```

OUTPUT:

```
Enter the EmpId :
155
Enter the Name :
SARATH
Enter the Age :
25
Enter the Salary :
15000
EmpID : 155, Name : SARATH, Age : 25, Salary : 15000
```

2) Write the point about class and object discussed in the class.

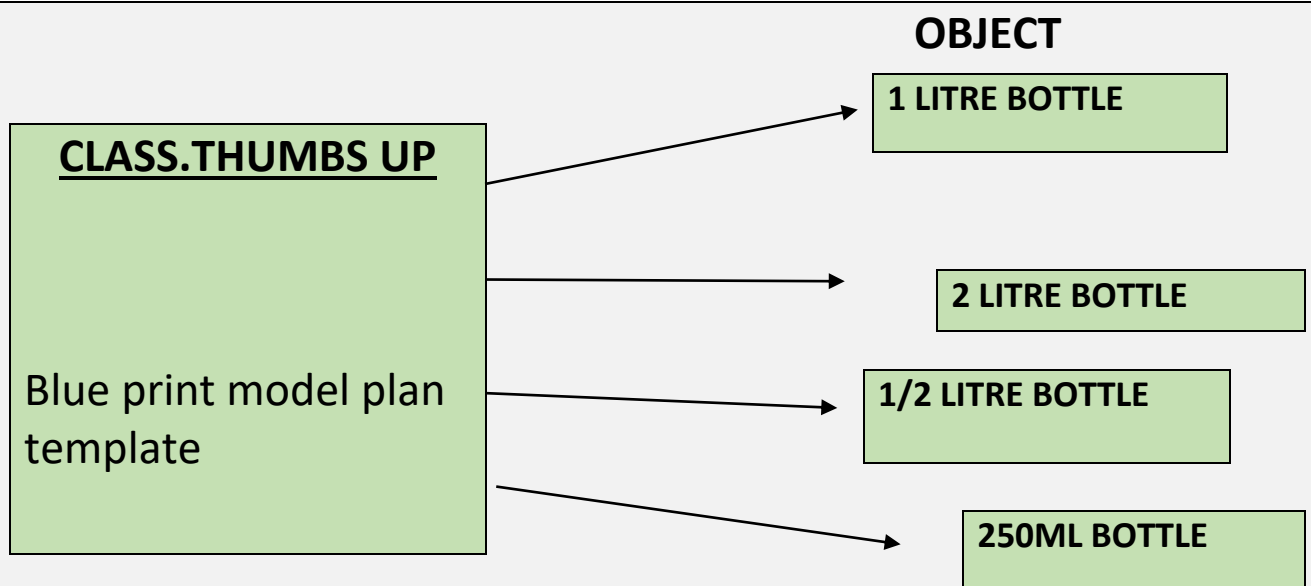

Class:

- Class is group of variable and method.
- Class is like a design to create a object.
- A class consists of state(variable) and behavior(method).

Objects:

- An object is an instance of a class.
- We can create any number of objects.
- Objects occupy memory.
- Object are reference type.

3) Pictorially represents class and object.

**Class : Collections of similar object.
Each Oject consists of different variables.**

5) Create Employee object and initialize with values while creating object and print the values.

CODE:

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
// sarath kasimsetty
//Create Employee object and initialize with values while creating object and
//print the values.
namespace Day7MorningProject5
{
    internal class Employee
    {
        public int Id;
        public string Name;
        public int Salary;
    }
    internal class Program
    {
        static void Main(string[] args)
        {
            Employee emp = new Employee() { Id = 12, Name = "sarath", Salary =
265626 };

            Console.WriteLine("EmpId = {0} ,Name= {1} ,Salary ={2}", emp.Id,
emp.Name, emp.Salary);
            Console.ReadLine();

        }
    }
}
```

OUTPUT:

```
EmpId = 12 , Name= sarath ,Salary =265626_
```

**6) create employees array object and initialize with 5 employees
write code using for loop ,for loop ,lambda expression.**

CODE:

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
//sarath kasimsetty
//create employees array object and initialize with 5 employees
//write code using for loop,for loop ,lambda expression.
namespace Day7MorningProject6
{
    internal class Employee
    {
        public int Id;
        public string Name;
        public int salary;
    }
    internal class Program
    {
        static void Main(string[] args)
        {
            Employee[] employees = new Employee[]
            {
                new Employee(){Id = 101, Name = "sarath", salary=1000},
                new Employee(){Id = 102, Name = "phani", salary=1200},
                new Employee(){Id = 103, Name = "suresh", salary=1400},
                new Employee(){Id = 104, Name = "ramesh", salary=1500},
                new Employee(){Id = 105, Name = "mahesh", salary=1700}
            };

            //forloop
            Console.WriteLine("*****Print by using For
Loop*****");
            for (int i=0;i<employees.Length;i++)
            {
                Console.WriteLine($"EmpId = {employees[i].Id}, EmpName =
{employees[i].Name}, Empsalary = {employees[i].salary}");
            }

            //foreach loop
            Console.WriteLine("*****Print by using Foreach
Loop*****");
            foreach (var d in employees)
            {
                Console.WriteLine("Empid = {0},EmpName = {1},Empsalary =
{2}",d.Id,d.Name,d.salary);
            }
            //lambda expression
        }
    }
}
```

```

        Console.WriteLine("*****Print by using Lambda
expression*****");
        employees.ToList().ForEach(e => Console.WriteLine("Empid = {0},EmpName =
{1},Empsalary = {2}", e.Id, e.Name, e.salary));

        Console.ReadLine();
    }
}

```

OUTPUT

```

*****Print by using For Loop*****
EmpId = 101, EmpName = sarath, Empsalary = 1000
EmpId = 102, EmpName = phani, Empsalary = 1200
EmpId = 103, EmpName = suresh, Empsalary = 1400
EmpId = 104, EmpName = ramesh, Empsalary = 1500
EmpId = 105, EmpName = mahesh, Empsalary = 1700
*****Print by using Foreach Loop*****
Empid = 101,EmpName = sarath,Empsalary = 1000
Empid = 102,EmpName = phani,Empsalary = 1200
Empid = 103,EmpName = suresh,Empsalary = 1400
Empid = 104,EmpName = ramesh,Empsalary = 1500
Empid = 105,EmpName = mahesh,Empsalary = 1700
*****Print by using Lambda expression*****
Empid = 101,EmpName = sarath,Empsalary = 1000
Empid = 102,EmpName = phani,Empsalary = 1200
Empid = 103,EmpName = suresh,Empsalary = 1400
Empid = 104,EmpName = ramesh,Empsalary = 1500
Empid = 105,EmpName = mahesh,Empsalary = 1700
_

```

7) Write code to print employees who is getting salary >=1500 using for loop, for each loop, lambda expression.

CODE:

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
//sarath kasimsetty
// write code to print employees who is getting salary >=1500 using
// for loop,foreach loop,lambda expression

namespace Day7MorningProject7
{
    internal class Employee
    {
        public int Id;
        public string Name;
        public int salary;
    }
    internal class Program
    {
        static void Main(string[] args)
        {
            Employee[] employees = new Employee[]
            {
                new Employee(){Id = 101, Name = "sarath", salary=1000},
                new Employee(){Id = 102, Name = "phani", salary=1200},
                new Employee(){Id = 103, Name = "suresh", salary=1400},
                new Employee(){Id = 104, Name = "ramesh", salary=1500},
                new Employee(){Id = 105, Name = "mahesh", salary=1700}
            };

            //forloop
            Console.WriteLine("*****Print by using For
Loop*****");
            for (int i = 0; i < employees.Length; i++)
            {
                if (employees[i].salary >= 1500)
                {
                    Console.WriteLine($"EmpId = {employees[i].Id}, EmpName =
{employees[i].Name}, Empsalary = {employees[i].salary}");
                }
            }

            //foreach loop
            Console.WriteLine("*****Print by using Foreach
Loop*****");
            foreach (var d in employees)
            {
                if (d.salary >= 1500)
                {
                    Console.WriteLine("Empid = {0},EmpName = {1},Empsalary = {2}", d.Id,
d.Name, d.salary);
                }
            }
        }
    }
}
```

```

//lambda expression
Console.WriteLine("*****Print by using Lambda
expression*****");
employees.ToList().Where(e => e.salary >= 1500).ToList().ForEach(e =>
Console.WriteLine("Empid = {0},EmpName = {1},Empsalary = {2}", e.Id, e.Name, e.salary));

Console.ReadLine();

    }
}
}

```

OUTPUT:

```

*****Print by using For Loop*****
EmpId = 104, EmpName = ramesh, Empsalary = 1500
EmpId = 105, EmpName = mahesh, Empsalary = 1700
*****Print by using Foreach Loop*****
Empid = 104,EmpName = ramesh,Empsalary = 1500
Empid = 105,EmpName = mahesh,Empsalary = 1700
*****Print by using Lambda expression*****
Empid = 104,EmpName = ramesh,Empsalary = 1500
Empid = 105,EmpName = mahesh,Empsalary = 1700

```

8) Similar to 6 and 7 projects create list of Customer an Product Arrays and practice for, foreach and lambda expression

CODE: Class of customer

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;

namespace Day7MorningProject8
{
    internal class Customer
    {
        public int Id;
        public string name;
        public string email;
    }
}
```

CODE: Class if product

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;

namespace Day7MorningProject8
{
    internal class Product
    {
        public int Id;
        public string Name;
        public int Price;
    }
}
```

CODE: system.cs

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
// Similar to 6 and 7 projects create list of Customer an Product Arrays
//and practice for, foreach and lambda expression
namespace Day7MorningProject8
{
    internal class Program
    {
        static void Main(string[] args)
